

Topics to be Covered

- *Elements of Step-Growth Polymerization*
- *Branching Network Formation*

Chapters 1 & 2 in CD (Polymer Science and Engineering)

Dawn of Understanding

"I am inclined to think that the development of polymerization is perhaps the biggest thing that chemistry has done, where it has had the biggest effect on everyday life"

—Lord Todd, 1980

Staudinger

“My dear chap, give up your ideas on big molecules. There are no organic molecules with a molecular weight of more than 5000. Just clean up your products and they will crystallize and reveal themselves as low-molecular-weight compounds”.

A cyclic isoprene dimer

Timeline

1920 – STAUDINGER;
The macromolecular hypothesis.

1926 – CHARLES STINE;
*Initiates a program of fundamental
research at du Pont.*

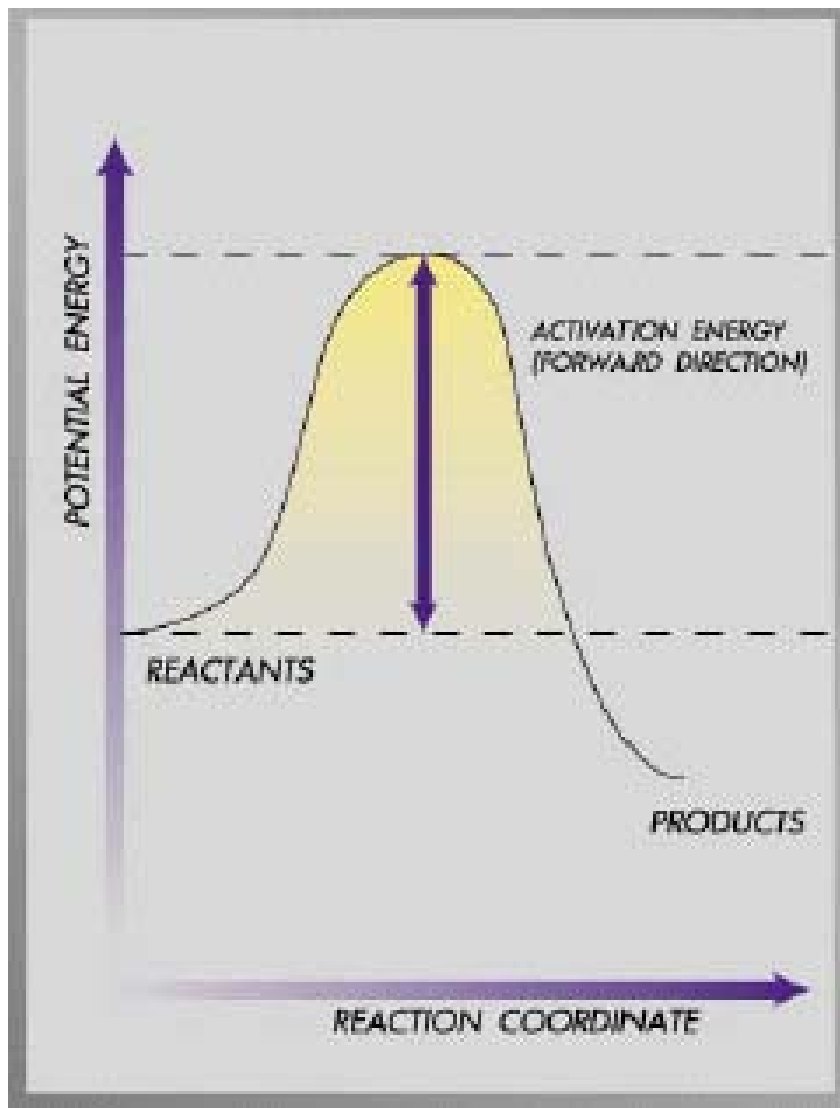

LATE 1920's – CAROTHERS;
*Set out to prove the existence of
macromolecules by systematically
building them from small molecules
using well known chemistry.*

Condensation Reactions

Why do Molecules React ?

Acetic Acid

kersplat!

**Ethyl Alcohol
or Ethanol**

Why do Molecules React ?

This isn't what really happens, but shows you how the valency electrons get rearranged

Making a Polymer

If we heat acetic acid and ethanol up to just over 100°C, to get the reaction going and drive off water, why don't we form polymer?

Making a Polymer

The molecules are monofunctional;

To make linear chains we need bifunctional molecules;

Except the reaction doesn't happen all in one go, like this, but in a step-growth fashion.

Making a Polyester

Monomers

Dimer

Making a Polyester

Note, reacting a diacid and a dialcohol will give you a polyester!

Etc.

The Invention of Nylon

1927 - Stine offers Carothers a job.

1929 - Carothers and his group succeed in making low molecular weight aliphatic polyesters

research, Du Pont, 1938*

Du Pont Announces for the World of Tomorrow...

a new word and a new material

NYLON

NBETTER THINGS for the World of Tomorrow...
The new chemical textile fiber, nylon, is
derivable from coal, air and water. It is
characterized by extreme toughness and
strength. It is the most important
development in the history of the
textile industry.

Nylon is a synthetic fiber made from
petroleum, air and water. It is the first
synthetic fiber to be made from these
materials. It is the most important
development in the history of the
textile industry.

BETTER THINGS FOR BETTER LIVING...THROUGH CHEMISTRY

Stockings!

Demonstration of knitting nylon stockings at the N.Y. World's Fair, 1939

*Marie Wilson's Leg, 2 ton 35 ft
cast, N.Y. World's Fair 1939*

DuPont did a masterly job in two areas;

- Advertising*
- Technical Service*

Why Stockings?

As skirts got shorter after the end of WWI, shocking expanses of leg were being revealed and the appearance and "feel" of stockings became a pressing fashion concern. And, there was money to be made! At that time nothing could compare with silk for sheerness. Wool was thick and scratchy; cotton was, well, cotton, not very exciting; rayon also was not sheer enough and tended to droop and bag at the ankles. But, silk was expensive and not very durable (silk stockings would "run" at the slightest provocation). Nevertheless, about 1.6 million pairs of silk stockings were being *a day* in the U.S. alone!

Golden Gate Exposition, 1939

*Wilmington gets the
first nylon stockings,
1939*

*May 15 1940 - "Nylon Day".
Four Million pairs go on sale
throughout the U.S. Supply
exhausted in 4 days.*

**Forward March!
Delaware!!**

We take this opportunity to congratulate the DUPONT COMPANY for bringing to the Women of America a new kind of hose made of NYLON Thread, a new wonder product from the laboratories of the DUPONT COMPANY and manufactured at SEAFORD in our home State of DELAWARE.

This is another example of the well known DUPONT slogan . . .

*"Better Things for
Better Living
Through Chemistry"*

Sold Out!

New York Times February 5, 1946

Yesterday Macy's sold
50,000 pairs of nylons...

An apology to those
who didn't get theirs...

Yesterday, for the fourth time since early November, Macy's put nylons on sale. We had 50,000 pairs. We started selling at 9:45 in the morning, and stopped at 2:12 when the supply ran out. As you might expect, there were customers still on line who were disappointed.

To them we want to say that we're terribly sorry. As the world's largest store, we have proportionately large shipments of nylons—but we have, by far, so many more customers than any other store that it's impossible to supply more than the smallest fraction of them at any one time.

We'll be selling nylons again. We wish we could tell you when or how, but we don't know ourselves. Please continue to be patient with us.

Sorry — for the present
we have no more nylons!

Macy's

A Tragic End

Carothers in happier times.

Polymer Synthesis - Classification

Carothers suggested that most polymers could be classified into two broad categories according to the mechanism of polymerization;

- *Condensation*
- *Addition*

As you will see, a better classification may be;

- *Step-growth*
- *Chain*

Types of Reactions

Condensation

Addition

Ring opening

Nylon 6,6

Nylon 6,10

What would nylon 6,10 look like?

More on Nylons

Applications

Carpet Fibers

Clothes

Gear wheels

Etc.

Back to Condensation

Is a molecule of water always split out?

The Nylon Rope Trick

The Nylon Rope Trick

Polyurethanes

A reaction that does not involve the splitting out of a small molecule;

Hexamethylene Diisocyanate

Ethylene Glycol

Urethane Linkage

Network Formation

How would you make chains that branch and then perhaps interconnect to form networks?

- A. Use a mixture of bifunctional and monofunctional units*
- B. Get a tube of Molecular Super Glue and stick a bunch of chains together*
- C. Use multifunctional ($f > 2$) monomers*

Network Formation

*The hydrogens in the ortho and para positions to the OH group, which by convention are not usually shown but here are indicated by a *, can react with formaldehyde to form (initially) oligomers.*

Another Condensation Reaction

Network Formation

Step-Growth Polymerization ; Summary
